Date	21 October 2026
Team ID	Individual Project
Project Name	StaffSync – Modern Human Resource Management System
Maximum Marks	2 Marks

Problem – Solution Fit Overview

The Problem–Solution Fit for StaffSync evaluates how a centralized Human Resource Management System can address common HR workflow challenges for Employees, Managers, and HR. The solution focuses on bringing employee records, attendance, leave management, announcements, training, performance information, and notifications into one web-based application.

Purpose

- Provide a centralized place to manage employee and manager information instead of maintaining disconnected records.
- Simplify attendance recording and make attendance history easier for employees and authorized HR or managers to review.
- Make leave requests and approval decisions traceable, with employees able to check request status.
- Help HR communicate organizational updates through announcements and system notifications.
- Support training and performance workflows by keeping relevant information accessible to authorized users.
- Improve data protection through authenticated access, role-based permissions, and secure password handling.

Problem Statement

Organizations may rely on separate tools, spreadsheets, emails, or manual processes to maintain employee records, attendance, leave applications, and internal announcements. These fragmented workflows can lead to duplicate data, delayed approvals, limited visibility into request status, and difficulty producing consistent HR summaries. Access to sensitive employee information also needs to be controlled according to each user's role.

Solution

StaffSync is a MERN-stack HRMS designed for three user roles: Employee, Manager, and HR. It brings core HR workflows into a single web application, with a React frontend, Node.js/Express backend, and MongoDB database.

- Authentication and role-based access for Employee, Manager, and HR accounts.
- Employee profile and staff-record management for authorized users.
- Attendance recording and attendance-history views.
- Leave application submission, status tracking, and authorized approval or rejection.
- HR announcements and user-facing notifications.
- Training information and performance records for permitted users.
- Role-appropriate dashboards and summaries based on available data.

Problem–Solution Fit Summary

Problem / Need	StaffSync Response	Expected Benefit
Scattered employee records	Centralized employee and manager information.	Less duplication and easier record access.
Manual attendance tracking	Digital attendance records and history.	Improved visibility and easier review.
Slow or unclear leave approvals	Leave requests with status and authorized review.	More transparent approval workflow.
Inconsistent internal communication	Announcements and notifications.	Users can find relevant updates in one place.
Limited HR overview	Role-appropriate dashboard summaries.	Faster access to available HR metrics.
Sensitive data access concerns	Authentication and server-side role-based authorization.	Better control over protected information.

Scope and Validation Note

The expected benefits above describe the intended fit between the problem and StaffSync's planned capabilities; they are not claims of measured business impact. Actual effectiveness should be validated through user feedback and testing of the implemented features. Features such as payroll, biometric integration, recruitment, or third-party HR integrations are not included here unless separately implemented in the current project.
